General Comment:Dear Sirs:

OSHA-2007-0032? Document ID ? OSHA-2007-0032-0001 relative to regulations of transport and storage of small arms ammunition and components is not needed. To use disasters relative to munitions exploding in WWII or a fertilizer load on ship as justifications to regulate commercial transport and sales of ammunition is wrong. Worker safety is not an issue here. Ammunition is loaded with flammable propellants that are not explosives. The propellants are derived from explosives in such a way that they are flammable only under conditions of extreme heat. They are not dangerous or hazardous materials.

I go on record as opposing any such changes in OSHA regulations.
