

Those new blue headlights create hazardous conditions for oncoming motorists. And those additional rack lamps beneath the headlights (usually white) only intensify the glare. I drive almost exclusively in a suburban area with plenty of street lighting, so those glaring lights serve no ostensible purpose other than to irritate the rest of us motorists. Also, who aims the headlights of all those SUVs that keep shining in my side and rearview mirrors? Do they come that way from the factory? If so, why can't a simple adjustment be made at the factory to lower them to eliminate the glare? I certainly don't expect the SUV owners to have to do that themselves! If they were considerate of us other drivers and concerned about conserving our natural resources and reducing foreign dependence on oil, they wouldn't be buying those monsters in the first place.
